KEY OBSERVATIONS	
WHAT THE DATA SAYS	BUSINESS DIAGNOSIS
Cancelled orders (250) are the single largest order outcome, exceeding Delivered (231), Pending (237), Returned (247) and Shipped (235)	We are losing more orders than we are completing through any single outcome this represents significant revenue leakage that requires urgent investigation into the root causes of cancellations
Chair (178 orders, \$195,620) and Printer (181 orders, \$195,612) lead in total revenue despite not having the highest order counts, suggesting their average order value is higher than other products	Our highest revenue products are not necessarily our most frequently ordered — the business should investigate what drives higher spend per order on Chairs and Printers and replicate that across other categories
The mean TotalPrice (\$1,053.97) is significantly higher than the median (\$823.62), indicating the data is right-skewed with 8 confirmed high-value outliers above \$3,330.41	A small number of high-value orders are inflating the average — the typical customer actually spends around \$823, meaning business decisions based on the mean alone would misrepresent the true typical customer experience
Facebook has the highest average order value (\$1,098.29) but only 228 orders, while Instagram has the most customers (259 orders) at \$1,062.88 average	Neither channel dominates outright — Facebook delivers more value per order while Instagram delivers more volume. The optimal strategy is to invest in both rather than choosing one over the other
